

Exponent®
Engineering & Scientific Consulting

Carolyn Scrafford, Ph.D., M.P.H.

Principal Scientist | Chemical Regulation and Food Safety
Washington DC
+1-202-772-4928 tel | cscrafford@exponent.com

Professional Profile

Dr. Scrafford has 20 years of experience in epidemiological methods, applied statistics, and risk assessment to evaluate the human health effects of food contaminants and additives, nutrients, and environmental compounds in the U.S. as well as Europe and other international settings. She has designed, conducted, and analyzed data from clinical trials, market basket surveys, and customized surveys on food consumption patterns and has experience in conducting dietary risk assessments for novel food ingredients, nutrients, heavy metals, and contaminants.

Dr. Scrafford has expertise in the synthesis of epidemiological evidence to both quantitatively and qualitatively evaluate causal associations between dietary and environmental exposures and health outcomes.

Dr. Scrafford has developed GRAS notifications, Food Additive Petitions (FAPs), and Color Additive Petitions (CAPs) in support of pre-market approval submissions to the U.S. FDA as well as regulatory submissions to other international authoritative bodies by providing evaluations of the human safety data and conducting dietary exposure assessments. The exposure assessments are based on a variety of large databases from the US and other countries including NHANES (National Health and Nutrition Examination Survey), the United Kingdom's National Diet and Nutrition Survey (NDNS), EFSA's Comprehensive European Food Consumption Database, and USAID's Demographic and Health Surveys (DHS).

Dr. Scrafford also provides technical and expert support related to dietary exposure to food toxins and contaminants including lead, cadmium, inorganic arsenic, and acrylamide. Dr. Scrafford has expertise in designing sampling protocols with the objective to determine levels of components and contaminants in food products currently in the market place. Dr. Scrafford is responsible for analyzing the survey results to estimate the concentration of the contaminants in the food that is combined with consumption data to estimate consumer exposure to these compounds through the diet.

Dr. Scrafford has recently evaluated study protocols for clients conducting clinical trials designed to measure the association between novel food and dietary supplement products on specific health outcomes including weight loss and gastrointestinal health in support of safety and efficacy evaluations. She has also collaborated with academic institutions to investigate the association between dietary patterns and health outcomes using data from ongoing prospective cohort studies. In 2014, Dr. Scrafford published a methodological report for USAID's Demographic and Health Surveys Program (DHS) with researchers at Hopkins and ICF International relating to maternal mortality estimates from over 30 developing countries.

Dr. Scrafford has an undergraduate degree in Biology from Colgate University. Concurrent to her work at Exponent, she earned her MPH (Masters of Public Health) in environmental health, MHS (Masters of

Health Science) in Biostatistics, and a Ph.D. and post-doctoral fellowship in epidemiology at Johns Hopkins University Bloomberg School of Public Health. While at Hopkins, Dr. Scrafford was awarded a training grant from 2008-2010 by the National Institutes of Health to conduct research related to maternal and child nutrition and health in international settings. Her dissertation work took place in Nepal where she was responsible for the design, implementation, and management of a hospital-based prospective study aimed at improving the community-based diagnosis of pneumonia in children.

Dr. Scrafford is a Professorial Lecturer at George Washington University's Milken Institute School of Public Health where she teaches a course on global child health. She is a member of the American College of Epidemiology, the International Epidemiological Association, and the American Society for Nutrition. She has co-authored many peer-reviewed published scientific manuscripts relating to the work she has done both at Exponent and in collaboration with colleagues at Johns Hopkins University and in Nepal.

Academic Credentials & Professional Honors

MHS, Biostatistics, Johns Hopkins University, 2013

Ph.D., International Health, Johns Hopkins University, 2013

M.P.H., Public Health, Johns Hopkins University, 2004

B.S., Biology, Colgate University, 1999

Professorial Lecturer, Global Health, George Washington University, 2019 - present

Delta Omega Scholarship Award, 2011

Johns Hopkins Center for Global Health Field Research Award, 2011

National Institutes of Health Training Grant in International Maternal and Child Health, 2008-2010

Postdoctoral Scholar, Global Disease Epidemiology and Control, Johns Hopkins University, 2014

Professional Affiliations

International Epidemiological Association

American College of Epidemiology

American Society for Nutrition

Potassium chloride-based replacers: modeling effects on sodium and potassium intakes of the US population with cross-sectional data from NHANES 2015-2016 and 2009-2010.

Potassium chloride-based replacers: modeling effects on sodium and potassium intakes of the US population with cross-sectional data from NHANES 2015-2016 and 2009-2010.

Project Experience

Wrote, reviewed, and critiqued study protocols for clinical trials designed to evaluate association between novel food and dietary supplement products and health outcomes.

Conducted nutritional epidemiological research and analysis to investigate the potential association between dietary components (e.g., flavonoids, eggs) and heart health.

Conducted dietary risk assessments in support of Proposition 65 cases for acrylamide, lead, 4-MEI, and caffeine.

Conducted analyses to measure how environmental factors and characteristics of cell phone use affect radiofrequency (RF) power output, a surrogate measure of individual exposure from mobile phone use.

Analyzed data from a community study investigating the relationship between arsenic found in soil and arsenic in urine among young children.

Analyzed data on lead levels in chocolate and other candies in support of a Proposition 65 case to determine the source of the lead and potential dietary exposure among candy consumers in the US population.

Conducted epidemiological analyses on data from a community study to determine SIRs based on Census records to account for non-response and potential biases in the study population.

Conducted research on the association of diet components and health status. The research objective is to support potential claims by a major food company.

Analyzed microbial growth data and developed predictive microbial models to be used to support proposed new processing methods for food products.

Analyzed data from several surveys of consumer products use and developed summary distributions for use in risk assessments of compounds/contaminants in these consumer products.
